This presentation will help us understand the different factors that affect unemployment in Austria.

Motivation

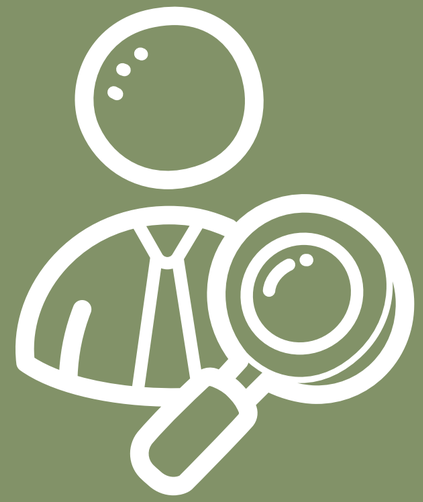

This dataset was chosen by our group because we are interested in seeing the different factors that affects unemployment in Austria.

The results from this visualization may assist help the appropriate authorities deal with these issues surrounding the unemployment in Austria

Description of the Dataset

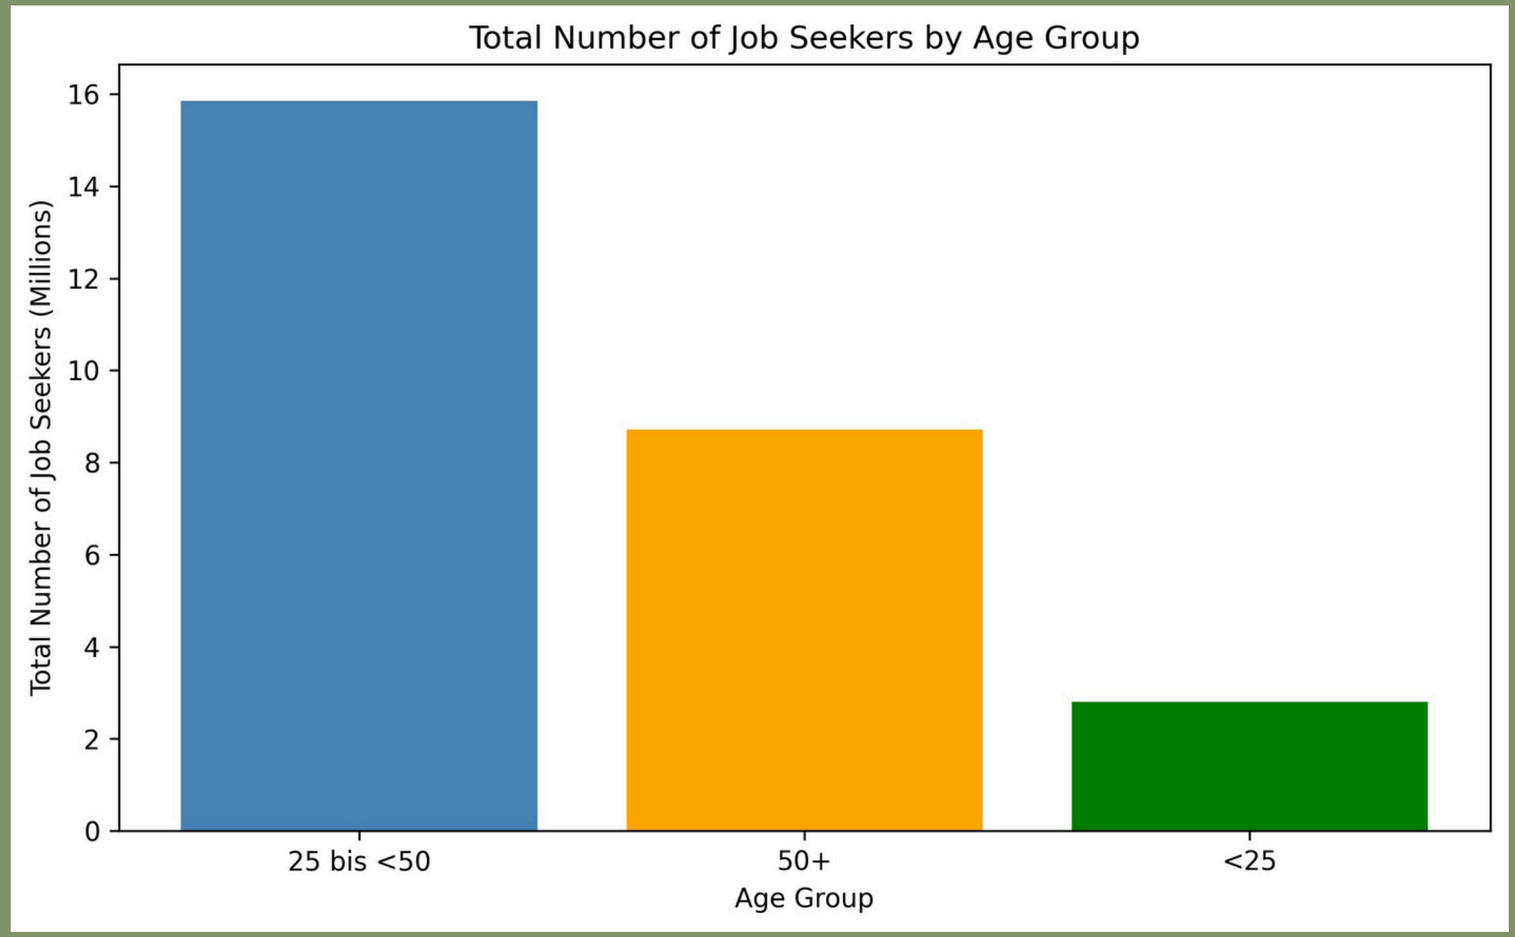

The dataset contains monthly labor market statistics on registered unemployed persons in Austria, provided by the Austrian Public Employment Service (AMS) via data.gv.at. It spans from January 2019 to March 2026 and captures unemployment stocks, inflows, and outflows — broken down by age group, region, gender, and nationality.

Hypothesis/Task

Simple Hypothesis
Age Group

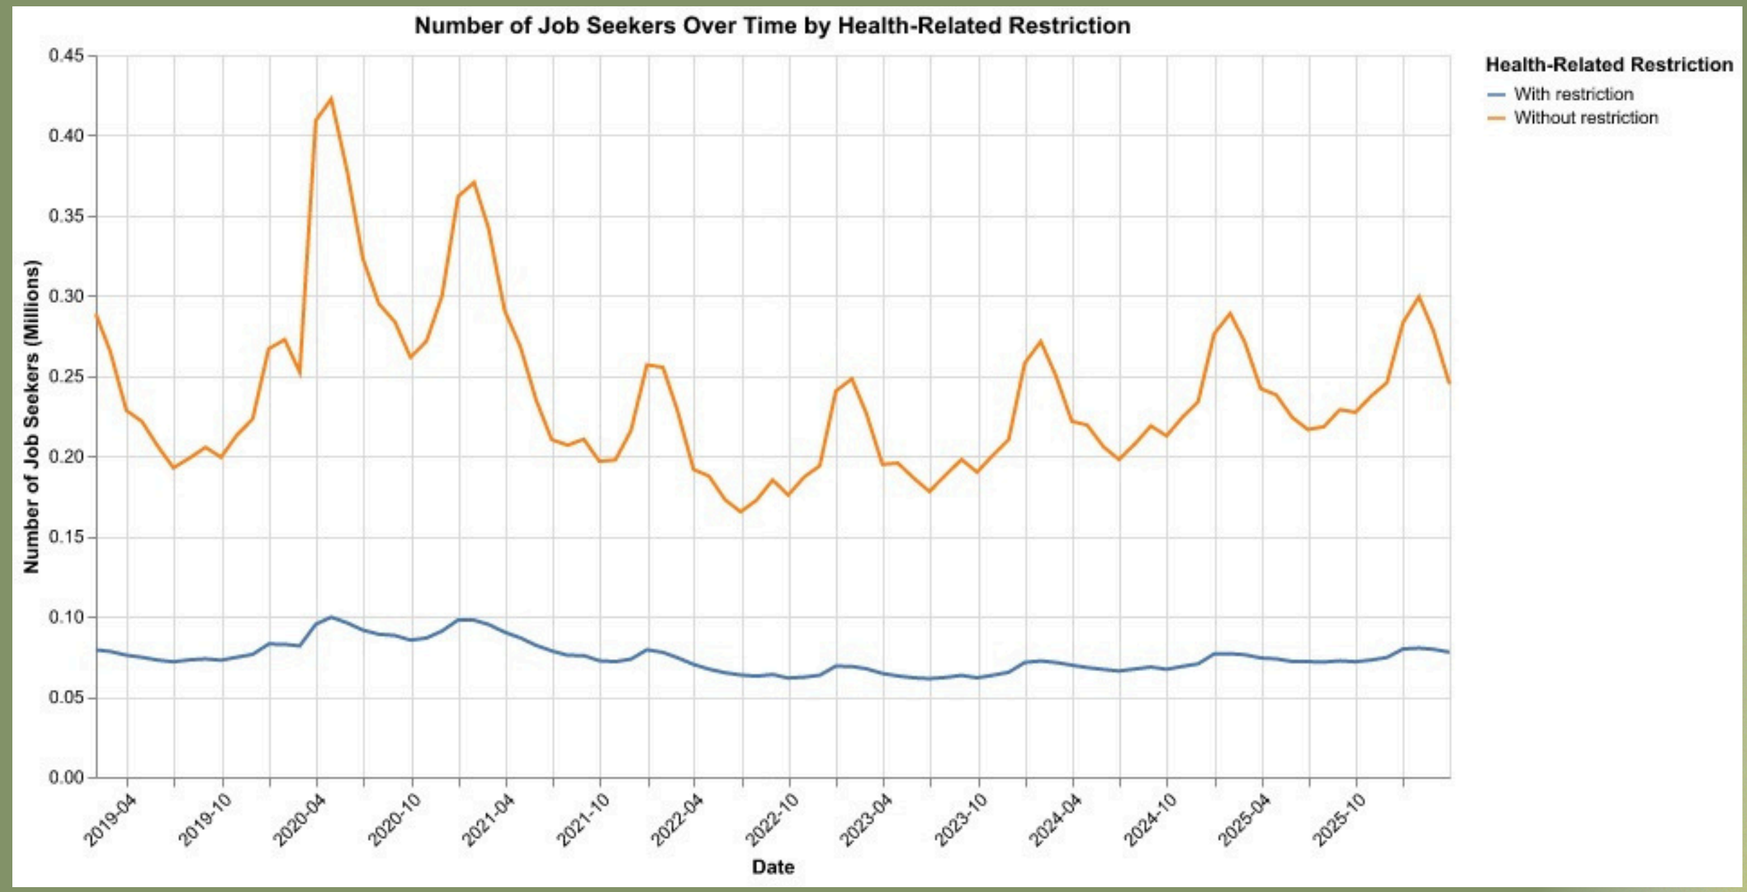

Unemployment levels vary significantly across age groups. The 25–50 age group has the highest number of registered job seekers at approximately 16 million, followed by the 50+ group at 8.5 million, while the under-25 group has the lowest at approximately 2.8 million.

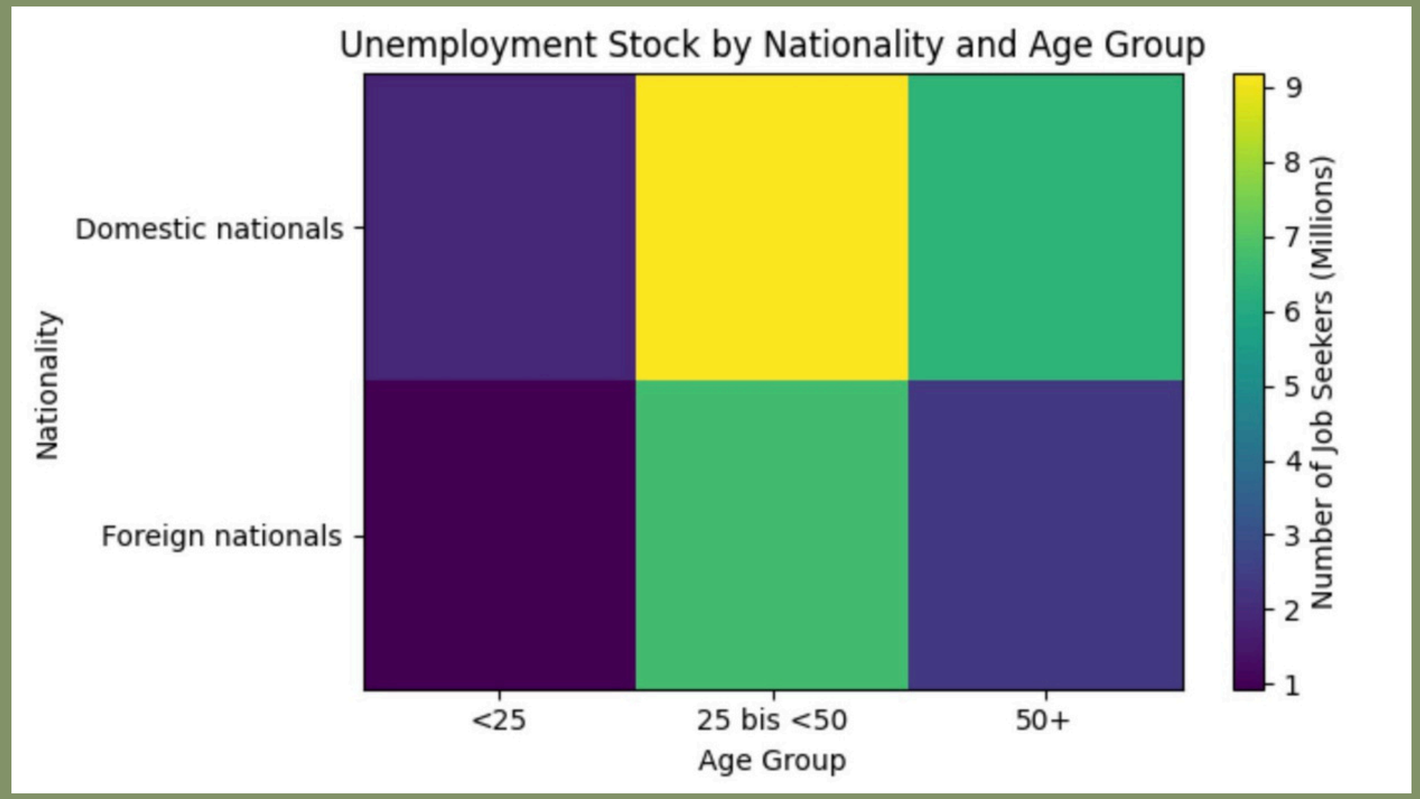

Hypothesis/Task

Simple Hypothesis Health Restriction

The line chart reveals that individuals without health-related placement restrictions consistently show higher unemployment stock, with both groups following similar trends over time. However, as the chart shows absolute totals, group size differences may also be a contributing factor.

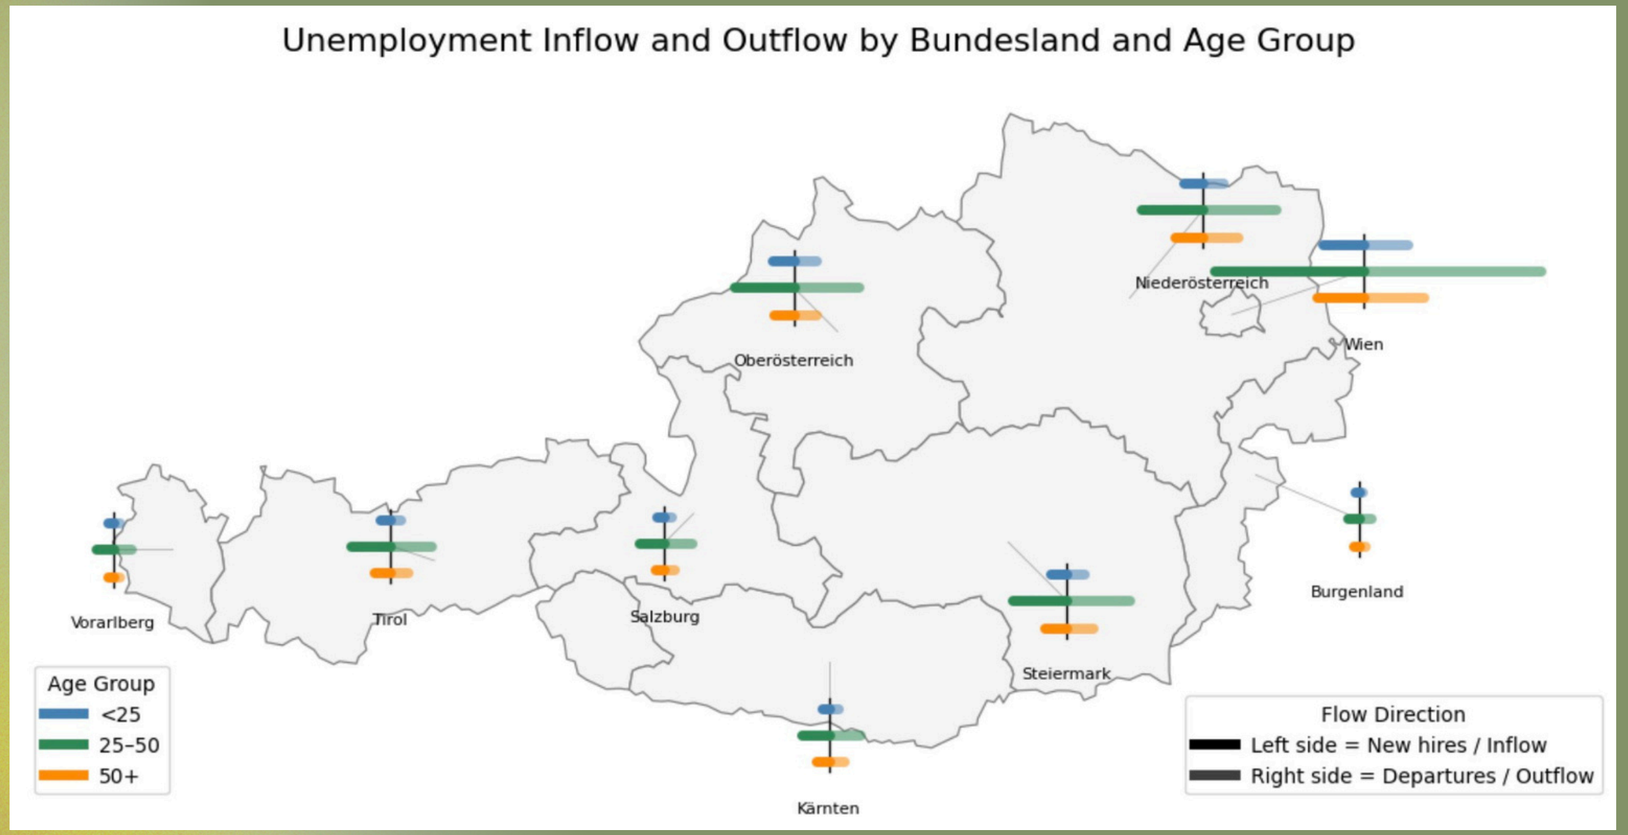

Hypothesis/Task

Complex Hypothesis
Nationality

The heatmap shows unemployment stock by nationality and age group, with color intensity representing job seeker volume. The 25–50 group has the highest concentration for both domestic and foreign nationals, with domestic nationals showing the largest overall values — supporting the hypothesis that unemployment stock differs across both nationality and age group.

Hypothesis/Task

Complex Hypothesis Age Group

The visualization shows unemployment inflow and outflow across Austrian Bundesländer by age group, with line length representing volume and color representing age. The 25–50 group dominates both inflow and outflow across most regions, particularly in Wien and Niederösterreich — supporting the hypothesis that unemployment dynamics vary by both age group and region.

Fanatstic Four

Summary

Monthly labor market data from Austria's Public Employment Service (AMS), spanning 2019–2026 across all regional districts. It breaks down unemployment stocks, inflows, and outflows by age group, gender, nationality, and placement restrictions — offering a multidimensional view of unemployment trends and regional disparities.

Thank You
